

Syllabus Links and Topic Detail

Overview

The Cranedale Centre has had extraordinary success in delivering the new **AQA biology** specification 2015. Our fieldwork topics are tailored to coach students through the much of the content of AS/A-level **Topic 4** and A-Level **Topics 5 & 7** (examined in Papers 1, 2 and 3).

The **Required Practicals** are the cornerstone of our courses and we craft the fieldtrip around them to allow students to grow in confidence in the associated *Apparatus & Techniques, Practical and Mathematical Skills* and the opportunity to demonstrate progression in their practical competency.

Syllabus content is strong throughout the trip and students are encouraged to make notes and draw connections between different parts of the specification. We also seek to inspire students beyond the specification through our enthusiasm for the subject and the experiential nature of the fieldtrip. Outlined in this document is a list of our most popular activities that we offer, complete with the associated syllabus links.

A typical Biology fieldtrip to the Cranedale Centre

We always work closely with individual school teachers to tailor the content of the fieldtrip to their requirements. Outlined below is a fairly typical format for a biology fieldtrip.

Before the fieldtrip, we send out a student research worksheet that helps to inform the choices they make when planning and undertaking Required Practical 12. This allows CPAC 5b to be achieved.

On the fieldwork days leading up to Required Practical 12, we train students in a range of practical sampling skills, in addition to syllabus support. These may include choosing and justifying sampling techniques in fieldwork, assessing different measures of abundance and calculating uncertainties.

On the last evening, students work in groups to design a sampling strategy, choose the size and type of quadrat, the number of repeats and the statistical test (CPAC 2d).

On the final day, Required Practical 12 is completed by students who have ample opportunity to demonstrate practical mastery of all CPAC elements, showing increasing independence and confidence. Our tutors continue to provide site and species information and guide groups with the use of instruments.

Photograph: Thomas Webborn

Required Practical 12

We offer a range of titles, that include freshwater or rocky shore habitats (depending upon tides). Prior to the fieldtrip we can send out a student worksheet to help them to reference and research that will then inform the planning (CPAC 5b) of Required Practical 12.

On the fieldwork days leading upto the Required Practical 12, we train students in a range of practical sampling skills, in addition to syllabus support.

On the last evening, students work in groups to design a sampling strategy, choose the size and type of quadrat, the number of repeats and a statistical test (CPAC 2d). They also carry out a full risk assessment (CPAC 3a).

On the day of the Required Practical 12, there is ample opportunity for students to demonstrate practical mastery of the CPAC elements and scientific skills as our tutors continue to provide site and species information and guide groups with the use of instruments. Statistical analysis is carried out using iPads in the field with each student group reporting their findings at the end, generating a holistic understanding of the biotic and abiotic interactions within the ecosystem.

AT Skills: **a** (use of appropriate apparatus), **b** (use of appropriate instrumentation to record qualitative measurements such as a colorimeter), **d** (use of light microscope at low power with a graticule), **e** (produce a scientific drawing from observation with annotations), **h** (safe and ethical use of organisms), **j** (safely use Instruments for dissection), **k** (use sampling techniques in fieldwork), **l** (use ICT software or data logger to collect and process data)

Mathematical Skills: 1.1, 1.2, 1.3, 1.4, 1.5, 1.6, 1.7, 1.9, 1.11, 2.1, 3.2

Syllabus Links referenced:

Topic 4 (4): Adaptation (anatomical, physiological and behavioural)

Topic 4 (5): Phylogenetic classification, taxonomy, evolution

Topic 4 (6): Biological diversity, species richness, Diversity Index

Topic 7 (4): Conflict between human needs and conservation

Topic 7 (4): Species occupy a niche governed by abiotic and biotic factors

Topic 7 (4): The population size can vary as a result of the effect of abiotic factors, interactions between organisms, inter/intraspecific competition

Topic 7 (4): Ecosystems are dynamic systems, ranging in size from very small to very large

Topic 7 (7): Random quadrats, belt transect

Topic 7 (4): Ecosystems, community, populations, habitat, niche, biotic/abiotic factors, competition, predation, % frequency, % cover

Chromatography of Seaweeds (Required Practical 7)

Students use thin-layer chromatography to investigate the photo-pigments of red, brown and green seaweeds. Their results are then used as evidence by the students to answer challenging questions about the relatedness of seaweeds to terrestrial plants and suggest possible patterns of seaweed distribution with relation to light availability at depth within the intertidal zone.

AT Skills referenced: **a** (use appropriate apparatus), **c** (use laboratory glassware), **g** (separate biological compounds using thin layer chromatography)

Mathematical Skills referenced: 0.3, 2.4

Syllabus Links Referenced:

Topic 4 (4): Students should be able to show an understanding that adaptation and selection are major factors in evolution and contribute to the diversity of living organisms

Topic 4 (5): A phylogenetic classification system attempts to arrange species into groups based on their evolutionary origins and relationships.

Topic 5: In photosynthesis, light is absorbed by chlorophyll

Topic 5: The process of photosynthesis is common in all photoautotrophic organisms and the process of respiration is common in all organisms, providing indirect evidence for evolution.

Topic 5 (1): Students should be able to identify environmental factors that limit the rate of photosynthesis

Topic 7 (3): explain how evolutionary change over a long period of time has resulted in a great diversity of species

Microscopy of an Olive Mayfly Nymph

Using light microscopes at low power with graticules, students produce a scientific drawing to scale from observation of a live mayfly nymph and include annotations explaining its adaptations for gas exchange.

AT Skills referenced: **a** (use of appropriate apparatus), **d** (use of light microscope at low power with a graticule), **e** (produce a scientific drawing from observation with annotations) and **h** (safe and ethical use of organisms)

Mathematical Skills referenced: 1.8

Syllabus Links referenced:

Topic 3 (2): Adaptations for gas exchange in insects (trachea, tracheoles and spiracles)

Topic 4 (4): Adaptation (anatomical, physiological and behavioural), evolution

Owl Pellet Dissection

Students safely use instruments to dissect an owl pellet and use a light microscope with graticule to produce a scientific drawing with scale bar and annotations. Students show competency in the safe use of mounted needles and points to mount specimens. Time permitting, students use the Chi2 test to compare Barn Owl diets between the Yorkshire Wolds and nearby Vale of Pickering.

AT Skills referenced: **a** (use of appropriate apparatus), **d** (use of light microscope at low power with a graticule), **e** (produce a scientific drawing from observation with annotations) and **j** (safely use Instruments for dissection)

Mathematical Skills referenced: 1.8, 1.9

Syllabus Links referenced:

Topic 4 (4): Natural selection results in species that are better adapted to their environment. Adaptation (anatomical, physiological and behavioural), evolution

Topic 4 (4): Show understanding that adaptation and selection are major factors in evolution and contribute to the diversity of living organisms.

Topic 7 (4): An ecosystem supports a certain size of population of a species, called the carrying capacity. This population size can vary as a result of: the effect of abiotic factors; interactions between organisms: interspecific and intraspecific competition and predation.

Choice Chamber Experiment with Freshwater Shrimp —Required Practical 10

Students will investigate the effect of an environmental variable such as light levels or substrate material on the movement of shrimp, Gammarus pulex, using a choice chamber. To conclude, students will process their data using an iPad and will be trained in the use of the Chi2 test.

AT Skills: **a** (use of appropriate apparatus), **b** (use of appropriate instrumentation to record qualitative measurements such as a colorimeter) **d** (use of light microscope at low power with a graticule), **e** (produce a scientific drawing from observation with annotations) **h** (safe and ethical use of organisms) and **j** (safely use Instruments for dissection) **k** (use sampling techniques in fieldwork), **l** (use ICT software or data logger to collect and process data)

Mathematical Skills referenced: MS 1.9

Syllabus Links referenced:

Topic 6 (1): Organisms increase their chance of survival by responding the changes in their environment.

Topic 6 (1): Taxes and kineses as simple responses that can maintain a mobile organism in a favourable environment.

Energetics & Farming

Agricultural Energetics

Students quantify the productivity of two contrasting agricultural-ecosystems in an effort to determine the sustainable future of farming in an increasingly crowded world. Students calculate and contrast the net productivity of indoor commercial breed pigs and outdoor rare breed pigs. The farming practices that are designed to increase productivity (increasing efficiency of energy transfer and reducing respiratory losses) are quantified and calculated. Students also use observations of the characteristics of the pig herd to interpret and predict the results of a monohybrid cross.

Trout Farm Energetics

Students visit a local fish farm to investigate the effect of aquaculture on the water quality of a fresh-water ecosystem by measuring a range of abiotic variables upstream and downstream of the farm system. Variables include oxygen, turbidity, temperature, conductivity, nitrate, ammonium and phosphate. In addition students gain an understanding of the way farmers are manipulating the energy efficiency of Rainbow Trout, itself an ectotherm, and calculate the growth rate, productivity and daily respiratory losses of various species of farmed fish. The sustainability of aquaculture and farming techniques that reduce biodiversity are also discussed.

AT Skills referenced: a (use of appropriate apparatus), b (use of appropriate instrumentation to record qualitative measurements such as a colorimeter), h (safe and ethical use of organisms)

Mathematical Skills referenced: 0.1, 0.3, 0.4, 2.2, 2.3, 2.4, 3.1, 3.2, 3.5, 3.6,

Syllabus Links Referenced:

Topic 4 (6): Farming techniques reduce biodiversity

Topic 4 (6): The balance between conservation and farming

Topic 5 (1): Evaluate data from agricultural practices used to overcome limiting factors

Topic 5 (3): Productivity, $GPP = NPP - R$ & $N = I - (F + R)$

Topic 5 (3): Productivity is affected by farming practices, manipulation of energy efficiencies, reducing respiratory losses, biomass

Topic 5 (3): Transfer of biomass and stored chemical energy in a community from one organism to another

Topic 7 (1): Genotypes, phenotypes, alleles, dominant, recessive, heterozygous, homozygous, mono/dihybrid crosses, sex linkage

Topic 7 (4): Conflict between human needs and conservation

Topic 7 (4): Sustainability

Population Studies

Overnight Population Studies with Data Logger

Setting humane traps including Longworth and camera for mammals, light traps for moths and pitfall traps for invertebrates equips students with a wide range of experience using equipment and techniques to monitor species populations. Students are challenged to employ safe and ethical scientific practices when setting each trap and evaluate the limitations of each trapping method. In addition, students set-up a Data Logger to record the overnight humidity, air temperature, wind speed and direction and associate the success of the trap with conditions overnight.

AT Skills referenced: a (use of appropriate apparatus), h (safe and ethical use of organisms), and I (use ICT software and data logger to process data)

Mathematical Skills referenced: 1.2, 1.3

Syllabus Links referenced:

Topic 4 (5): Phylogenetic classification, taxonomy

Topic 4 (5): Adaptation and evolution, natural selection

Topic 7 (4): Isolation of populations, natural selection, variation, carrying capacity, inter/intra-specific competition, predation

Topic 7 (4): Species occupy a niche governed by abiotic and biotic factors

Topic 7 (4): The population size can vary as a result of the effect of abiotic factors, interactions between organisms, inter/intraspecific competition

Topic 7 (4): Ecosystems are dynamic systems, ranging in size from very small to very large

Topic 7 (4): Ecosystems, community, populations, habitat, niche, biotic/abiotic factors, competition, predation

Bat Walk

Students are able to use specialist ICT equipment and software that collects and logs bats' ultrasonic calls. Using GPS to track the position of each bat sighting, calls are automatically interpreted and species identified whilst they explore different habitats and local roost sites.

AT Skills: a (use of appropriate apparatus), h (safe and ethical use of organisms) I (use ICT software or data logger to collect and process data)

Mathematical Skills referenced: 1.3

Syllabus Links referenced:

Topic 4 (5): Phylogenetic classification, taxonomy

Topic 4 (5): Adaptation and evolution, natural selection

Topic 7 (4): Species occupy a niche governed by abiotic and biotic factors.

Topic 7 (4): Ecosystems, community, populations, habitat, niche, biotic/abiotic factors, competition, predation

Topic 7 (4): Isolation of populations, natural selection, variation, carrying capacity, inter/intra-specific competition, predation

Population Studies

Mark, Release, Recapture & the Lincoln Index

Using 'snail-varnish', students are able to calculate the population size of a locally abundant motile species (the brown-lipped snail *Cepaea nemoralis*) using the mark-release-recapture method. Following the practical, students will better appreciate the assumptions of the technique and evaluate the results with reference to these.

AT Skills: **a** (use of appropriate apparatus), **h** (safe and ethical use of organisms), **k** (use sampling techniques in fieldwork)

Mathematical Skills referenced: 1.1, 1.5, 2.1, 2.2, 2.3

Syllabus Links referenced:

Topic 4 (5): Adaptation and evolution, natural selection

Topic 7 (4): Species occupy a niche governed by abiotic and biotic factors

Topic 7 (4): Isolation of populations, natural selection, variation, carrying capacity, inter/intra-specific competition, predation

Topic 7 (3): Populations, population size of motile organisms, Mark Release Recapture and its assumptions, competition, predation

Topic 7 (4): The population size can vary as a result of the effect of abiotic factors, interactions between organisms, inter/intraspecific competition

Topic 7 (4): Ecosystems are dynamic systems, ranging in size from very small to very large

Topic 7 (4): Community, populations, habitat, niche, biotic/abiotic factors, competition, predation

Natural Selection in *Cepaea nemoralis*

Students explore the allele's effects on shell phenotype in this species which wears its genes on its banded back. The Hardy-Weinberg principle is used to calculate the frequency of alleles and genotypes. Woodland and grassland habitats are sampled to investigate whether selection is at work.

AT Skills: **a** (use of appropriate apparatus), **h** (safe and ethical use of organisms), **k** (use sampling techniques in fieldwork)

Mathematical Skills referenced: 1.1, 1.5, 2.1, 2.2, 2.3

Syllabus Links referenced:

Topic 4 (4): Genetic diversity and principles of natural selection

Topic 4 (5): Phylogenetic classification, taxonomy, adaptation and evolution, natural selection

Topic 7 (1): Genotype, phenotype, alleles, dominant, recessive, codominant

Topic 7 (2): Calculating gene frequencies using Hardy-Weinberg concepts of gene pools and allele frequency

Topic 7 (4): Isolation of populations, natural selection, variation, carrying capacity, inter/intra-specific competition, predation

Succession Studies

Chalkland Succession (Summer)

Wharram Quarry (SSSI) is a rare and species rich ecosystem where succession is managed for conservation by the Yorkshire Wildlife Trust as a chalk grassland habitat. Students use point-frame quadrats, data-loggers, pooters and beating trays to investigate primary succession on a lithosere. Using their own primary data on the vegetation, microclimate, soil and invertebrates, students are challenged to solve the chronological sequence of succession.

Sand Dune Succession (All year)

Primary succession on a psammose is investigated by students at Bridlington South Sands, a small sand dune ecosystem on the east coast. Students are able to observe adaptations of xerophytic plants and carry out the classic belt transect using quadrats and percentage cover to investigate the changes in vegetation in relation to edaphic factors.

Wetland Succession (Spring & Autumn)

Tophill Low (SSSI) is a managed nature reserve run by Yorkshire Water. Students are able to observe management of succession whilst gathering data from five distinct seral stages (both aquatic and terrestrial). Data-loggers and a range of abiotic instruments are used by the students to measure the soil, microclimate, flora and fauna. To conclude, students are challenged to piece together the sequence of succession of a hydrosere using their own primary data.

Moorland Succession (All year)

The North York Moors National Park is a heavily managed landscape, causing deep-running conflicts between conservationists and gamekeepers. Students sample an area of heather moorland owned and managed by the National Trust (Bridestones Moor, SSSI) using quadrats, data-loggers and abiotic equipment to investigate the changes associated with primary succession on a lithosere. Using their own primary data on the vegetation, microclimate, soil and invertebrates, students are then challenged to solve the chronological sequence of succession.

AT Skills: **a** (use of appropriate apparatus), **h** (safe and ethical use of organisms), **k** (use sampling techniques in fieldwork), **l** (use ICT software or data logger to collect and process data)

Mathematical Skills referenced: 0.3, 1.1, 1.2, 1.5, 1.6, 1.11, 2.1

Syllabus Links referenced:

Topic 4 (7): Random sampling

Topic 7 (4): Succession, primary succession, pioneer species, climax community

Topic 7 (4): Conservation of habitats frequently involves management of succession

Topic 7 (4): Species occupy a niche governed by abiotic and biotic factors

Topic 7 (4): Ecosystems, community, populations, habitat, niche, biotic/abiotic factors, competition, predation, % frequency

Biodiversity in Freshwater

Students design and carry out fieldwork to identify the impact of crayfish on the biodiversity of freshwater ecosystems. Students will kick sample two streams, one containing crayfish and identify all freshwater species using hand-lenses and dichotomous keys. Abiotic variables including dissolved oxygen concentration, nitrate and turbidity are measured and Simpson's Biodiversity estimates for each stream are then calculated. Students then utilise their own primary data to evaluate conflicting evidence regarding the future conservation of native crayfish species.

AT Skills: **a** (use of appropriate apparatus), **b** (use of appropriate instrumentation to record qualitative measurements such as a colorimeter) **h** (safe and ethical use of organisms), **k** (use sampling techniques in fieldwork)

Mathematical Skills referenced: 0.1, 1.1, 1.2, 1.4, 1.5, 1.6, 1.11, 2.1, 2.3

Syllabus Links referenced:

Topic 4 (4): Adaptation (anatomical, physiological and behavioural), evolution

Topic 4 (6): Biological diversity, species richness, Diversity Index

Topic 5 (4): Fertilisers, leaching, eutrophication

Topic 7 (4): Conflict between human needs and conservation

Classification & Taxonomy

Upon returning to the classroom after freshwater fieldwork investigations, students are challenged to classify the freshwater species they encountered and to construct a phylogenetic tree. The theory behind taxonomy – the classification of diversity is discussed alongside the fundamentals of the biological principles of speciation, natural selection and extinction.

AT Skills:

Mathematical Skills referenced:

Syllabus Links referenced:

Topic 4 (5): Phylogenetic classification, taxonomy

Topic 4 (5): Adaptation and evolution, natural selection

Topic 4 (5): One hierarchy comprises the taxa: domain, kingdom, phylum, class, order, family, genus and species

Topic 4 (5): Each species is universally identified by a binomial consisting of the name of its genus and species, e.g. *Homo sapiens*

Topic 4 (5): A phylogenetic classification system attempts to arrange species into groups based on their evolutionary origins and relationships. It uses a hierarchy in which smaller groups are placed within larger groups, with no overlap between groups. Each group is called a taxon (plural taxa).

Freshwater Energetics

Students conduct kick samples from a freshwater stream to catch and identify all species using hand lenses and dichotomous keys. The biomass of all aquatic organisms is quantified and students use their own primary data to construct pyramids of biomass, energy and trophic efficiency.

AT Skills: **a** (use of appropriate apparatus), **b** (use of appropriate instrumentation to record qualitative measurements such as a colorimeter) **h** (safe and ethical use of organisms), **k** (use sampling techniques in fieldwork)

Mathematical Skills referenced: 0.1, 1.1, 1.2, 1.4, 1.5, 1.6, 1.11, 2.1, 2.3

Syllabus Links referenced:

Topic 4 (4): Adaptation (anatomical, physiological and behavioural), evolution

Topic 4 (6): Biological diversity, species richness, Diversity Index

Topic 5 (4): Fertilisers, leaching, eutrophication

Topic 5 (3): Transfer of biomass and stored chemical energy in a community from one organism to another

Topic 7 (4): Conflict between human needs and conservation

Topic 7 (4): Ecosystems, community, populations, habitat, niche, biotic/abiotic factors, competition, predation

Marine Energetics

Filey Brigg (SSSI) is a biologically rich rocky shore environment which provides a dramatic and engaging ecosystem for fieldwork. Students place random quadrats within the inter-tidal zone and quantify the biomass of all organisms found whilst also being able to observe both anatomical and behavioural adaptations. Students use their own primary data to construct pyramids of biomass, energy and trophic efficiency.

AT Skills: **a** (use of appropriate apparatus), **b** (use of appropriate instrumentation to record qualitative measurements such as a colorimeter) **h** (safe and ethical use of organisms), **k** (use sampling techniques in fieldwork)

Mathematical Skills referenced: 0.1, 1.1, 1.2, 1.4, 1.5, 1.6, 1.11, 2.1, 2.3

Syllabus Links referenced:

Topic 4 (4): Adaptation (anatomical, physiological and behavioural), evolution

Topic 4 (6): Biological diversity, species richness, Diversity Index

Topic 5 (3): Transfer of biomass and stored chemical energy in a community from one organism to another

Topic 7 (4): Ecosystems, community, populations, habitat, niche, biotic/abiotic factors, competition, predation

Rocky Shore Ecology

The peninsula of Filey Brigg (SSSI) has tremendous opportunities for students to sample two shores with contrasting wave powers. Students participate in classic fieldwork techniques (such as belt transects and random sampling with quadrats) to gather robust primary data for use in all three statistical tests required at A-level. Differences in the morphology and population of limpets and the effect of desiccation on seaweed are two of the most popular studies. Students use refractometers for sea-water salinity, anemometers for wind speed and a site-specific wave height chart. Finally, students draw conclusions regarding the distribution of organisms on the rocky shore with relation to measured abiotic and biotic interactions (particularly inter/intra-specific competition).

AT Skills: **a** (use of appropriate apparatus), **h** (safe and ethical use of organisms), **k** (use sampling techniques in fieldwork)

Mathematical Skills referenced: 0.1, 0.3, 0.4, 1.2, 1.3, 1.4, 1.5, 1.6, 1.7, 1.9, 1.11, 2.1, 3.1, 3.2

Syllabus Links referenced:

Topic 4 (5): Phylogenetic classification, taxonomy

Topic 4 (5): Adaptation and evolution, natural selection

Topic 4 (7): Random sampling

Topic 7 (4): Species occupy a niche governed by abiotic and biotic factors.

Topic 7 (4): Ecosystems are dynamic systems

Topic 7 (7): Random quadrats, belt transect

Topic 7 (4): Ecosystems, community, populations, habitat, niche, biotic/abiotic factors, competition, predation, % frequency, % cover

Marine Conservation

The sustainability of North Sea fisheries yields is examined through visiting Bridlington Harbour and viewing the landing of shellfish. RSPB Bempton Cliffs (SSSI, SPA, SAC) provides opportunity for students to view spectacular seabird assemblages from 130m high chalk cliffs. As apex predators, seabirds indicate the health of an ecosystem and students are able to conduct an EIA, evaluate evidence and data concerning climate change and the conservation of iconic species such as the Gannet and Puffin.

AT Skills: **h** (safe and ethical use of organisms)

Mathematical Skills referenced: 3.1, 3.2

Syllabus Links referenced:

Topic 4 (6): Biological diversity, species richness, Diversity Index

Topic 7 (4): Management of the conflicts between human needs and conservation in order to maintain the sustainability of natural resources

Topic 7 (4): Evaluate evidence and data concerning issues relating to the conservation of species and consider conflicting evidence

Topic 7 (4): Species occupy a niche governed by abiotic and biotic factors.

Topic 7 (4): Ecosystems, community, populations, habitat, niche, competition, predation

Sustainable Woodland Ecosystems

The environmental and economic benefits of broadleaved and coniferous woodlands are quantified through fieldwork that includes random sampling and sweep netting for invertebrates. Using the circumference and height of each tree, students quantify mass of carbon within a coniferous plantation and the broadleaved Ellers Wood (SSSI, SAC) and draw links with climate change and the carbon cycle. Students then make informed conclusions relating to the sustainable management of woodlands, balancing the conflicts between human needs and conservation.

AT Skills: **a** (use of appropriate apparatus), **h** (safe and ethical use of organisms), **k** (use sampling techniques in fieldwork), **I** (use ICT software or data logger to collect and process data)

Mathematical Skills referenced: 0.3, 0.4, 1.1, 1.2, 1.6, 1.11, 2.1, 3.1, 4.1

Syllabus Links referenced:

Topic 5 (3): Biomass can be measured in terms of mass of carbon or dry mass of tissue per unit area per given time

Topic 7 (4): Management of the conflicts between human needs and conservation in order to maintain the sustainability of natural resources

Topic 7 (4): Species occupy a niche governed by abiotic and biotic factors

Topic 7 (4): Evaluate evidence and data concerning issues relating to the conservation of species and consider conflicting evidence

Topic 4 (7): Random sampling

Topic 7 (4): Ecosystems, community, populations, habitat, niche, biotic/abiotic factors, competition, predation, % frequency, % cover

Holly Leaf Miners

Students investigate the population dynamics of the Holly Leaf Miner (*Phytomyza ilicis*) by safely dissecting a holly leaf and producing a scientific drawing to scale and with annotations of the contents. Students will be able to show competency in the safe use of scalpels when identifying the fate of each leaf miner. To conclude, students are challenged to calculate the percentage survival and mortality rates and to predict the population size of future leaf miner generations.

AT Skills referenced: **a** (use of appropriate apparatus), **d** (use of light microscope at low power with a graticule), **e** (produce a scientific drawing from observation with annotations) and **j** (safely use Instruments for dissection)

Mathematical Skills referenced: 0.3, 1.3, 1.8, 3.2

Syllabus Links referenced:

Topic 4 (4): Natural selection results in species that are better adapted to their environment. Adaptation (anatomical, physiological and behavioural), evolution

Topic 4 (4): Show understanding that adaptation and selection are major factors in evolution and contribute to the diversity of living organisms.

Topic 7 (4): An ecosystem supports a certain size of population of a species, called the carrying capacity. This population size can vary as a result of: the effect of abiotic factors; interactions between organisms: interspecific and intraspecific competition and predation.
